

CONNECTIVITY TIPS

- 1. Router Placement:** If possible, place the router in a central location of the home. This way, the WiFi signal can spread evenly throughout.
- 2. Maximize WiFi Frequency Bands:** If you have a dual band router, you're able to better optimize the network by assigning specific devices to two different bands.
- 3. Disconnect Unused Devices:** Disconnect smart devices that are not being used that may be clogging your WiFi.
- 4. Call Your Internet Provider:** They can help you troubleshoot or help you to upgrade your router if it is outdated. Newer WiFi technology can vastly improve current issues.
